

UDSA / UDSB-D Series

HIGH EFFICIENCY ROOM SEALED UNIT HEATERS

UDSA / UDSB-D Series

HIGH EFFICIENCY ROOM SEALED UNIT HEATERS

Introduction

The UDSA and UDSB units are a technically advanced range of gas fired unit heaters designed to deliver outstanding energy efficiency, performance and economy for reduced operating and life cycle costs.

The heat exchanger achieves 92% thermal efficiency reducing energy consumption and running costs.

Reliable operation and simple servicing further reduce operating costs whilst the extended operational life of the heat exchanger ensures that the units provide the lowest long term cost benefits.

ECA

Authorised User No. 00182

This symbol verifies that units have been independently assessed and currently qualify for the ECA scheme, enabling businesses investing in energy-saving equipment to claim 100% first-year capital allowances against Corporation Tax.

Features and Benefits

- High efficiency
- Reduced energy bills
- Unique aerodynamic profile of the heat exchanger results in minimal resistance to airflow to give longer throws, improved temperature distribution and reduced temperature gradients
- Titanium stabilised aluminised steel heat exchanger for enhanced life expectancy
- New burner technology utilises a single self-aligning burner, with multi-try ignition for optimum reliability and ease of maintenance
- Versatile flue options for ease of siting

Applications

- Automotive workshops
- Factories
- Retail outlets
- Sports arenas and halls
- Warehouses
- Workshops

Model Range

UDSA units are fitted with a high airflow axial fan for free-blowing applications, with model heat outputs ranging from 11kW – 97kW.

UDSB-D units are fitted with a direct drive centrifugal fan for ducted applications or freeblowing heaters at increased mounting heights. The UDSB-D models are available with heat outputs ranging from 15kW – 64kW.

All units are available for natural gas (G20) as standard, but alternatively can be specified for use on Propane (G31).

Horizontal unit

Vertical downflow unit complete with optional four-way louvre

Versatile Flue Installation

The balanced flue terminal provides both the combustion air inlet and flue outlet from a single building penetration. The terminals are ordered separately from the heaters to suit either a wall outlet or roof outlet. Additional flue and combustion air pipes may be added, up to a maximum of nine metres of flue pipe, plus nine metres of combustion air pipe. (This reduces by 1.5 metres for every 90° bend fitted.)

To comply with CE approvals, balanced flue appliances must be used with the manufacturer's balanced flue system. The units are also certified for fan assisted flue installations, where the combustion air is to be drawn from within the heated space; an alternative wall or roof terminal is required for this application. When used without a combustion air pipe, a maximum of 14 metres of flue can be fitted. (This reduces by 1.5 metres for every 90° bend fitted.)

Balanced flue wall outlet (type C12) eliminates expensive roof opening and flashing

Balanced flue roof outlet (type C32)

Combustion air through wall, flue outlet through the roof (C52)

Separate combustion air and flue pipes (type C12) for applications where wall thickness exceeds 370mm

Installation

Units may be suspended or alternatively mounted on a suitable non-combustible support. Four integral suspension points complete with an M10 female thread are provided to each heater.

A single phase electrical supply is required to each unit. This supply should not be switched off except for maintenance.

Units must not be installed in atmospheres containing flammable or explosive vapours, combustible dust, halogenated hydrocarbons or chlorinated vapours. They are also unsuitable for areas where contaminants may affect electrical motors or connections.

Heater positions and flue arrangements are indicative. For heater and flue clearances please refer to the manufacturer's guidelines.

Optimised Control

To complement the high efficiency UDSA and UDSB units a versatile range of SmartCom control panels are available

- Self adapting optimum start and stop
- Simple user friendly programming
- Individual seven day programming
- Day, night and frost (5°C) temperature settings
- Three on/off periods per day
- Easy set overtime and holiday periods
- Remote burner reset facility
- Password protection to prevent unauthorised adjustment
- Hours run and service data logging
- Battery back up in the event of mains failure
- High / low or modulating burner control (SmartCom MZ required)

Optional SmartCom MZ panel allows up to 16 panels to be linked for centralised control

UDSA / UDSB-D Series

HIGH EFFICIENCY ROOM SEALED UNIT HEATERS

Specification

Heat Exchanger

Manufactured from titanium stabilised aluminised steel for enhanced life expectancy.

The unique aerodynamic profile results in minimal resistance to airflow to give longer throws, improved temperature distribution and reduced temperature gradients to minimise energy consumption.

Dual Limit Stats

Dual limit stats provide additional safety and reliability.

Optimised Air Distribution

Standard unit heaters

Higher roof space temperatures increase heat loss through roof

UDSA heaters

Reduced floor to ceiling temperature gradients

Self Aligning Burner

Advanced burner technology utilises a single self aligning burner, with multi-try ignition for optimum reliability and ease of maintenance.

Increased Airflow

A high capacity axial flow fan is fitted to UDSA units for improved air throws and reduced stratification.

UDSB-D models are fitted with a direct drive centrifugal fan.

The fan operation is controlled by an integral controller which delays the fan start up until the heat exchanger has reached operating temperature and continues to run the fan after the burner has switched off, until all useful heat has been dissipated.

An optional Econostat may be fitted to heaters installed at high level to recirculate warm air down to working level when the burner is switched off.

Enhanced Reliability and Safety

A microprocessor burner control provides full safety monitoring and multi-try ignition control for enhanced reliability.

Limit stats monitor the operating temperature within the heater unit and shut down the burner in the event of overheating. For additional safety all models are fitted with dual limit stats.

Venter Fan

High capacity venter fan allows extended flue runs. When used with a balanced flue system the units are fully room sealed to provide separated combustion thereby preventing dirt or dust from entering the combustion system.

A differential pressure switch shuts down the unit in the event of inadequate combustion air, blocked flue or flue fan failure.

1 Throw is dependent on mounting height, building height, room temperature and louvre settings. Throw distance relates to terminal velocity of 0.35m/s.

2 Actual noise levels are dependent on heater location and type of building. Noise levels for UDSB-D are at standard speed.

3 Natural gas G20 calorific value 10.5 kWh/m³ GCV, inlet gas pressure maximum 50mbar, minimum 17.5mbar.

Propane G31 calorific value 14.0 kWh/kg GCV, inlet gas pressure maximum 50mbar, minimum 37mbar.

4 Not supply line size.

5 Recommended height to underside of heater. Downturn nozzles are recommended on horizontal units where units are installed at higher mounting heights.

For buildings over 4 metres high, air re-circulation fans are recommended in conjunction with the heaters.

Mounting height depends on louvre setting.

Vertical downflow heaters should be used in conjunction with air re-circulation fans.

6 Standard airflow at 125Pa. UDSB-D models are supplied with fan speed factory set as shown in table.

For alternative duties the fan speed can be changed on site by simply relocating a wire in the electrical terminal strip.
